

## Wallboard module for ShireSystem software

Wallboard is a new module for your ShireSystem software that is a powerful way to visually share relevant, actionable data for your contractors, facilities and maintenance teams. With an up-to-date view of outstanding activities, it can help you comprehend and analyse leading performance indicators.

You can access Wallboard through any regular browser or internet enabled TV so it can be widely displayed across various locations to keep key stakeholders fully aware of all activities wherever they are based.

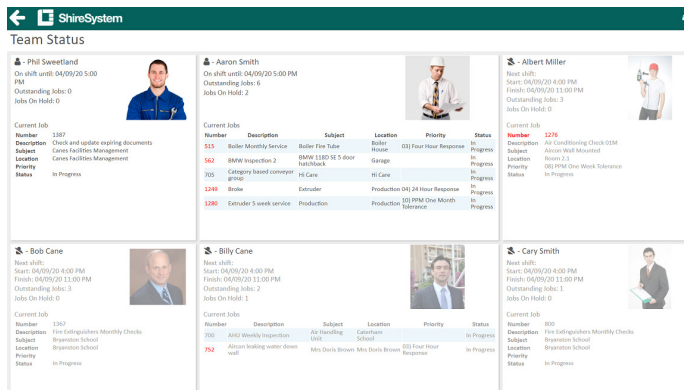

Wallboard is highly configurable: the display consists of individual tabs to allow you to focus on specific locations, work types, businesses, contractors etc. The tabs can be set to rotate as required. You can create individual wallboards for shifts, teams or groups of contractors with user tiles. Tiles allow you to see the current activity of each engineer, their outstanding work or next job, and anything they currently have on hold.

Wallboards help you to compare performance or spot underutilised staff and direct them to assist other colleagues. Images are used to make it easier to visualise larger teams.

# Shifts and Resource Planner User Tiles

Check the availability of your team, when somebody is on shift, or when they will next be available.

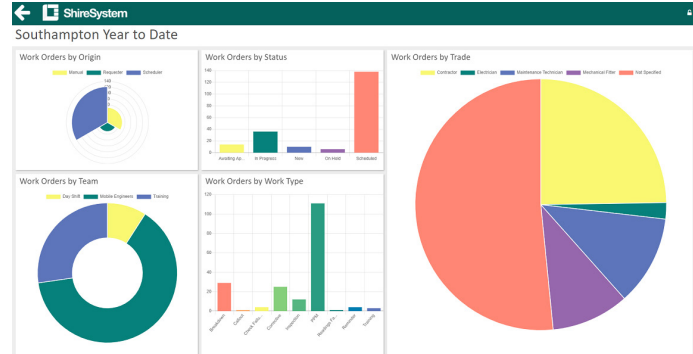

# Work Order and parts backlog stats with warning feature

Your Work Order backlogs can be broken down into simple user tiles, listing late and overdue Work Orders - plus any outstanding parts or critical parts that need to be reordered. Tiles can be configured to flash when a set limit has been reached and can be resized and colour coded as you require.

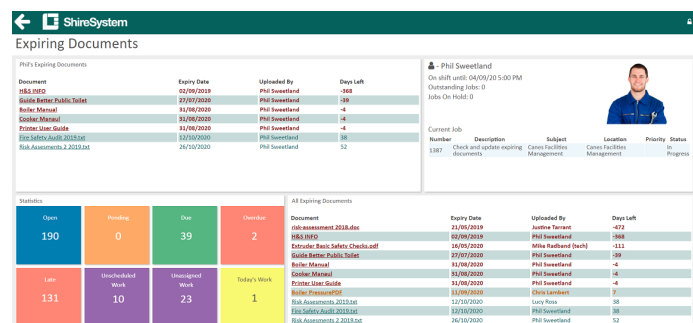

# Work Order breakdown

Work Orders can be displayed for you as intuitive graphs, based on work type, trade, status or origin to enable you to see current performance.

# Expiring documents

The expiring documents tile displays any documents that will expire in the period you have set. Documents can include Contracts, SLA, OEM's, Training Certificates, Procedures, Risk Assessment, Method Statements etc.

# Real-time view

You will have a live view of your current work list and the module allows for the switching between wallboards at set intervals and auto refreshes.
